## QUANTITATIVE REASONING ASSESSMENT REPORT

Byron Javier
City Colleges of Chicago
9/5/2017

## Summary

## Report on the Spring 2017 Assessment on Quantitative Reasoning Ability

During the spring 2017 semester, the Assessment Committee implemented a set of questions prepared by members of the committee. The questions were administered to students enrolled in Interdisciplinary courses and high level courses.

The instrument was designed to measure students' ability to apply aspects of quantitative reasoning to analyze a situation and solve a real-life problem.

The purpose of the research was to compare the performance of these two groups of students at different levels of their college education. The data consisted of 116 students enrolled in the College Success seminar and 224 students enrolled in higher level courses. The total enrollment at the College during spring 2017 semester was 5,189 students. The data represented $7 \%$ of the total enrollment. The demographic profile of the respondents closely matched that of the full student body with respect to gender, academic status, etc.

The following research questions guided the study:

- Is there a difference between the score of students enrolled in College Success seminar and students enrolled in higher level courses?
- Do students in higher level courses tend to do better on each question?

The results did not show a significant statistical difference between the groups in both research questions.

We will analyze further the results from this assessment to address areas we still to understand how to provide additional support to our students.

## Participants by Course

| Course | Count |
| :--- | :---: |

Differences are not statistically significant.

## APPENDIX: Instrument

1. The hemoglobin A1c (HbA1c) test measures average blood sugar levels for the 2-3-month period before blood is drawn. A HbA1c of $6 \%$ is equal to an average blood sugar of about 120 units. If your average blood sugar in the past 3 months is 270 units, approximately what is your HbA1c? (an increase of $1 \%$ in HbA 1 c is equivalent to an increase of 30 units).

2. According to the Institute of Medicine, children and adults should consume 45 to 65 percent of their calorie intake as carbohydrates, and at least 128 grams of carbs per day. The nutritional facts of the only sources of carbs available for you are shown below. How many cups of pasta, carrots, and bags of chips, respectively, will give you the exact daily minimum requirement of carbs?

3. You test your blood sugar 3 times a day. You purchase a prescription of 100 testing strips on March 5th. You use 1 strip per test. Of the dates below, by when will you need to buy new strips?

O March $21^{\text {st }}$
O April $7^{\text {th }}$
O April $21^{\text {st }}$
O May $21^{\text {st }}$
4. Use the graph below to determine whether or not the following statement is true or false:

## The smaller the city, the higher its murder rate.

Explain your answer using evidence from the graph as needed.
